Milestone Five

Features to Test	The three features we will be testing is the Registration Page, the Bird Reporting Page, and the Bird Validating Page. The reason for testing these features first is because they are the most essential for the functionality of the application. Once these features are tested and implemented, users will be able to register for an account, report birds they see around, and validate whether other user reported birds are actually where they say they are. These features make up about most of the functionality of the application and thus they should be tested first.
UAT Test Case Registration Page	--Here we will test to make sure that the user can register an account with our application. We will do this by setting up a tester on the Registration Page and having them go through the form to create an account.
UAT Test Case Bird Reporting Page	--Here we will test to make the user can report a bird that they see. This test will take place after the user has registered for an account. We will simulate bird sightings on paper and have the user go through the Registration Page and report the simulated bird sighting.
UAT Test Case Bird Validating Page	--Here we will test to make sure the a user can confirm a bird report by another user. This test will take place after the Reporting Page UAT as it depends on that page working. We will have the user scroll through the simulated post that were submitted in the previous UAT. We will also make some post that do not correspond to one of the

	<p>simulated sightings which will give the user a chance to test denying a report. While the user is scrolling through the reports for validation they will validate the birds that were in the simulation and deny the birds that do not correspond to one of the simulated sightings.</p>
